

Reveal® Imager

Christie Clinic's Radiance Cosmetic Center uses the Reveal® Imager computer imaging system.

Reveal® Imager is a tool that gives a cosmetic evaluation of your face. By examining the surface and subsurface of the skin, it is able to Reveal® what stands between you and your desired appearance. Be it sun damage, brown spots, redness, texture, spider veins, acne, or wrinkles, Reveal® Imager captures it all, giving you photographic evidence for your aesthetic treatment.

How Does it Work?

Reveal® Imager is a computer imaging system that uses standard white light and cross-polarized flash. It takes two photographs. The first shows how you look in everyday situations. The second eliminates the surface reflections from your skin and reveals what is beneath the skin. It is a comfortable procedure that has no side effects. With this second photograph, your provider can pinpoint the exact places where damage has occurred. This allows them to formulate a specialized treatment plan just for your skin. This includes recommended services or products which you can purchase or have done at your convenience. You can also reimage your skin during your treatment to monitor your skin's progress.
